

ABSTRACT

An ATM currency cassette (208) includes a plurality of movable cassette information indicator buttons (214). Each button can be rotated about an axis for repositioning. The buttons can be axially moved outward and inward relative to the cassette housing (210) by rotation thereof. Different axial arrangements of the buttons represent respective different characteristics of cassette content. The cassette can be inserted into an ATM where the button positions can be read by the ATM. The cassette enables unused buttons to remain therewith and also permits a button arrangement to be changed without requiring opening of the cassette.

ABSTRACT

An ATM currency cassette includes an RFID tag. The tag includes information about the cassette, such as the cassette serial number and the currency denomination. An ATM includes a tag reader that can interrogate the tag to receive the information. The history of a particular cassette can be tracked via the cassette serial number. Problem cassettes can be identified.
